ASX RELEASE

## Letter of Intent from Global Aluminium Manufacturer

LaserBond Ltd (LBL), the innovative engineering company specialising in energy efficient surfacing technologies and maintenance/reclamation services, has received a Letter of Intent (“LOI”) from one of the world’s leading manufacturers of aluminium sheet products. The LOI is a first step in LaserBond gaining approval to provide its unique surfacing technologies under contract to several US based production facilities. The next step will be a production trial of a major component treated by Laserbond for one of the US manufacturing facilities. This trial is pending and likely to commence before the New Year.

LaserBond was founded in 1992, specialising in the reclamation of industrial components utilising a range of cutting edge surfacing technologies. These technologies enable Laserbond’s customers in capital intensive industries to dramatically decrease their carbon footprint and costs by putting back into service machine parts which historically would have been scrapped. The continuous growth and development of LaserBond, its people, and its technologies, make it a global leader in a market segment increasingly in demand as industry becomes more environmentally aware, and strategic engineering materials more difficult to source.
